

IT Security FAQ

For Sales Teams and IT Stakeholders

This document answers the most common IT security and compliance questions that come up during the DonorDock evaluation process. Share it with IT managers, security teams, or procurement stakeholders who need to assess DonorDock before approving a purchase.

SOC 2 Type 1 & 2
Certified

Microsoft Azure
Cloud Hosted

US Data Centers
Only

MFA Supported
for All Users

Compliance and Certifications

Q: Is DonorDock SOC 2 compliant?

Yes. DonorDock holds both SOC 2 Type 1 and SOC 2 Type 2 certifications, audited by Thoropass (formerly Laika Compliance). The SOC 2 report is available upon request through our Trust Center at trust.donordock.com.

Q: Is DonorDock HITRUST certified?

No. HITRUST certification is primarily relevant for organizations handling protected health information (PHI) under HIPAA. Since DonorDock is a donor management platform and does not process or store PHI, HITRUST certification is not applicable to our use case.

Q: Is DonorDock HIPAA compliant?

DonorDock is a donor management CRM and does not process or store protected health information (PHI). HIPAA compliance is not applicable to our use case. That said, our data centers maintain compliance certifications for PCI, HIPAA, SOC 2, and FedRAMP frameworks at the infrastructure level.

Q: Does DonorDock align with GDPR requirements?

We do not claim formal GDPR compliance, as there is no formal GDPR audit or certification process. However, our controls and policies align closely with GDPR's core principles, including secure processing and transparent privacy practices. Our SOC 2 Type 2 certification independently validates our security, availability, and confidentiality controls.

Hosting and Infrastructure

Q: Is DonorDock cloud-hosted, on-premise, or a local install?

DonorDock is 100% cloud-hosted. There is no on-premise or local installation option. All infrastructure runs on Microsoft Azure.

Q: What cloud hosting provider does DonorDock use?

Microsoft Azure. DonorDock's entire platform runs on Azure infrastructure, including compute, storage, and networking.

Q: Where is DonorDock data stored?

All DonorDock data is hosted in US-based data centers only. Data is not hosted in or transferred to regions outside the United States. For organizations with data residency requirements, all donor data remains within US jurisdiction.

Authentication and Access Controls

Q: Does DonorDock support Single Sign-On (SSO)?

DonorDock does not currently offer SSO integration. We support two-factor authentication (2FA/MFA) for securing user accounts. Enterprise SSO capabilities are noted in our Trust Center roadmap.

Q: Does DonorDock support two-factor authentication (2FA/MFA)?

Yes. DonorDock supports multi-factor authentication (MFA) for all user accounts. We strongly recommend enabling MFA for all team members.

Q: What are DonorDock's password requirements?

DonorDock requires a minimum 8-character password length. There is not currently an option for organizations to enforce a custom minimum length beyond this default.

Q: Does DonorDock use role-based access controls (RBAC)?

Yes. DonorDock implements role-based access control so organizations can manage what team members can view and do within the platform. Access monitoring is continuous.

Data Security

Q: Is data encrypted at rest and in transit?

Yes. DonorDock encrypts all data both at rest and in transit. Data in transit is protected using TLS/SSL encryption. Data at rest is encrypted using Azure's built-in encryption capabilities.

Q: How often is data backed up?

DonorDock performs daily data backups. Our business continuity and disaster recovery (BC/DR) program is documented and regularly tested.

Q: Can our data be deleted if we leave DonorDock?

Yes. DonorDock supports data erasure. If your organization discontinues service, your data can be fully deleted per your request.

Security Operations

Q: Does DonorDock perform penetration testing?

Yes. DonorDock maintains an active penetration testing program. Pentest reports are available upon request through the Trust Center.

Q: What threat detection tools does DonorDock use?

DonorDock uses Microsoft Defender for Cloud for threat detection, vulnerability management, and security monitoring across the Azure infrastructure.

Q: Does DonorDock have an incident response plan?

Yes. DonorDock has a dedicated incident response team and a documented incident response plan. Security awareness training is mandatory for all employees.

Available Security Documents

The following documents are available upon request through the DonorDock Trust Center:

Document	Availability
SOC 1 Report	Available on request
SOC 2 Report (Type 1 & Type 2)	Available on request
Penetration Test Report	Available on request
Additional Security Documentation	Available on request

Need more detail?

Visit the DonorDock Trust Center for full documentation, downloadable reports, and the ability to request specific security artifacts.
